Abnormal count

162 - DE 7/8 to 8

F367

DE 1

F370

As 1.5, Ag 1.5 Ld 1.
gc 1??

This is a period when the lake was well mixed and turned over annually

m 19c mlgc, DE 8: the mlgc is ~ 10 mm thick and is essentially truncated at top

305 Ld 2 - As 1 Ag 1 Dg ?
gc 1 see Ld 2 - As 1 Ag 1 Dg ?
horizon of first turnover after DE 8

Ld 2 + As 1 Ag + Dg + gc 1 w/ rel. by amount of organic
Compare with base DE 9. gcl of

3mm base of DE 8 base of DE 8 does not appear to be erosional. Stirred-up lake debris just settled out on the lake bottom.

DE (8) 10

370 Laminated to granitely laminated
BS2
TSS3
1 single gl
AR N 96 - 26 364 cm
10 mm slice of $\frac{1}{3}$ of core (right log)
3480 ± 50 BP 8.5 my - 30.1%
AA - 23212 21, 14, 1, 18 (B)

big stormy

E448

E422

380 → Laminated
TSS3
1 single gl

390

MSU unit except for 1 or 2 discontinuous faint laminar interp: interval of annual lake turnover

E432

mlgc of DE 9 AS 2 Ld 1 Ag 1

<0.5 → the top of this mlgc is essentially truncated ← measure about this.

E435

DE (9)

E438 base?

400 gcl
gc 1 DE 9
base of gc 1 = AS 1.5 Ld 1.5 Ag 1
mid/upper gcl (a bit less clay) Ld 1.5 Ag 1
10 mm debris layer of DE 9 Ld 3 As/Ag 1 - Dg D₄ trace of sand
Trace of sand Why does base look like a gc

AR N 96 - 21 402 cm
8 mm slice from $\frac{1}{3}$ of core 17.9 my
- 28.2% (B)

3815 ± 50 BP

AA - 20181

E447

410 3-4 mm

well laminated
Mostly (> 90%) massive w/ visible burrows (interval of annual lake turnover?)
Abnormal count 152 - DE 9-10

1 mm upper contact slightly obscured by burrows in mlgc

420 mlgc
mlgc of DE 10

(no burrows occur in mlgc's higher in section ⇒ lake shallower at this time?)
